CLAIMS

1.   A method for classifying a data packet in accordance with one or more rules wherein the data packet contains a packet header that is used to classify the packet, the method comprising the steps of:

    dividing the packet header into a plurality of sections;

    for each section, performing a lookup operation to acquire a set of rules and a set of actions associated the section, wherein the set of rules represents one or more rules associated with the section and the set of actions contains an action for each rule represented in the set of rules;

    for a particular section, determining if each action in the set of actions indicates the same action for all the rules represented in the set of rules associated with the section; and

    if so, classifying the data packet based on the action indicated in the set of actions for the particular section.

2.   A method as defined in claim 1 comprising the steps of:

    determining if the lookup operation performed is a final lookup operation; and

    if so, classifying the data packet according to the results of the lookup operation.

3.   A method as defined in claim 2 wherein the final lookup operation yields a results table index.

4.   A method as defined in claim 3 comprising the step of:

    using the results table index to identify an action that is used to classify the data packet.

5.   A method as defined in claim 1 comprising the step of:

2   for the particular section, if each action in the set of actions is not the same, per-

3   forming a next-level lookup operation to identify a set of rules and a set of actions associ-

4   ated with a next level of classification.

1   6.   A method as defined in claim 1 wherein the acquired set of rules is represented as

2   a rule bitmap and the identified set of actions is represented as an action bitmap.

1   7.   A method as defined in claim 6 comprising the steps of:

2   for each section, using a value associated with the section to index a first-level

3   lookup table to acquire an equivalence set index associated with the section; and

4   using the equivalence set index to acquire a first-level rule bitmap and a first-level

5   action bitmap associated with the section.

1   8.   A method as defined in claim 7 comprising the steps of:

2   determining if the acquired action bitmap indicates the same action for all rules

3   represented in the rule bitmap; and

4   if so, classifying the packet based on the action indicated in the acquired action

5   bitmap.

1   9.   A method as defined in claim 7 comprising the step of:

2   determining if the acquired action bitmap indicates the same action for all rules

3   represented in the rule bitmap; and

4   if not, performing a next-level lookup operation.

1   10.   A method as defined in claim 1 comprising the steps of:

2   applying values associated with the sections to first-level lookup tables to acquire

3   equivalence set indices associated with the section;

4   generating a next-level lookup table index using the equivalence set indices;

5   applying the next-level lookup table index to a next-level lookup table to acquire

6   a next-level lookup table entry;

7   determining if the next-level lookup table entry is empty; and

8   if so, generating a next-level lookup table entry and a next-level equivalence set

9   entry associated with the next-level lookup table index.

1   11.   An apparatus for classifying a data packet in accordance one or more rules, using

2   a hierarchy of lookup tables, the hierarchy comprising a first level and one or more suc-

3   cessive levels, the data packet containing a packet header that is used to classify the

4   packet, the apparatus comprising:

5   a memory coupled to the processor and configured to hold the hierarchy of lookup

6   tables; and

1   a processor adapted to (i) divide the packet header into a plurality of sections, (ii)

2   perform a lookup operation for each section in a first-level lookup table associated with

3   the first level to acquire a set of rules and a set of actions associated with the rules for the

4   section, (iii) determine if the action specified for each rule in the set of rules is the same,

5   (iv) and if so, classifying the packet according to the action.

6   12.   An apparatus as defined in claim 11 wherein the processor is configured to per-

7   form a next-level lookup operation if the action specified for each rule in the set of rules

8   is not the same.

1   13.   An apparatus as defined in claim 11 wherein the processor is configured to deter-

2   mine if the lookup operation is a final lookup operation and if so, classify the data packet

3   according to the results of the lookup operation.

1   14.   An apparatus as defined in claim 11 wherein the acquired set of rules is repre-

2   sented as a rule bitmap and the identified set of actions is represented as an action bitmap.

1   15.   An apparatus as defined in claim 14 wherein the processor is configured to, for

2   each section, acquire an equivalence set index associated with the section and use the

3   equivalence set index to index an equivalence set to acquire a rule bitmap and action

4   bitmap associated with the section.

1   16.   An apparatus as defined in claim 15 wherein the processor is configured to deter-

2   mine if the acquired action bitmap indicates the same action for all rules represented in

3   the rule bitmap and if so, classify the packet based on the action indicated in the identi-

4   fied action bitmap.

1   17.   An apparatus as defined in claim 15 wherein the processor is configured to deter-

2   mine if the identified action bitmap indicates the same action for all rules represented in

3   the rule bitmap and if not, perform a next-level lookup operation.

1   18.   An intermediate node comprising:

2   means for dividing the packet header into a plurality of sections;

3   means for performing a lookup operation to acquire a set of rules and a set of ac-

4   tions associated with each section, wherein the set of rules represents one or more rules

5   associated with a section and the set of actions contains an action for each rule repre-

6   sented in the set of rules;

7   means for determining, for each section, if each action in the set of actions indi-

8   cates the same action for all the rules represented in the set of rules associated with the

9   section; and

10   means for classifying the data packet based on the action indicated in the set of

11   actions for the particular section if the action is the same.

1   19.   An intermediate node as defined in claim 18 comprising:

2   means for determining if the lookup operation performed is a final lookup opera-

3   tion; and

4   means for classifying the data packet according to the results of the lookup opera-

5   tion if the lookup operation performed is the final lookup operation.

1   20.   A computer readable medium comprising computer executable instructions for:

2   dividing a packet header, contained in a data packet that is used to classify the

3   data packet, into a plurality of sections;

4   for each section, performing a lookup operation to acquire a set of rules and a set

5   of actions associated the section, wherein the set of rules represents one or more rules as-

6   sociated with the section and the set of actions contains an action for each rule repre-

7   sented in the set of rules;

8   for a particular section, determining if each action in the set of actions indicates

9   the same action for all the rules represented in the set of rules associated with the section;

10   and

11   if so, classifying the data packet based on the action indicated in the set of actions

12   for the particular section.

1   21.   A method for classifying a data packet in accordance with one or more rules con-

2   tained in an access control list (ACL) wherein at least one of the rules contained in the

3   ACL is a wild-card rule and wherein the data packet contains a packet header that is used

4   to classify the packet, the method comprising the steps of:

5   dividing the packet header into a plurality of sections;

6   for each section, performing a lookup operation to acquire a set of rules associated

7   the section, wherein the set of rules represents one or more rules associated with the sec-

8   tion;

9   for a particular section, determining if a rule in the set of rules is associated with a

10   wild-card rule contained in the ACL; and

11   if so, classifying the data packet based on an action associated with the wild-card

12   rule.
